Grocery Android App using MVVM and Room Database in Kotlin

1. Introduction

      a. Overview

Android Studio is the official Integrated Development Environment (IDE) for Android app development, based on [IntelliJ IDEA](#). On top of IntelliJ's powerful code editor and developer tools, Android Studio offers even more features that enhance your productivity when building Android apps, such as:

- A flexible Gradle-based build system
- A fast and feature-rich emulator
- A unified environment where you can develop for all Android devices
- Apply Changes to push code and resource changes to your running app without restarting your app
- Code templates and GitHub integration to help you build common app features and import sample code
- Extensive testing tools and frameworks
- Lint tools to catch performance, usability, version compatibility, and other problems
- C++ and NDK support
- Built-in support for [Google Cloud Platform](#), making it easy to integrate Google Cloud Messaging and App Engine

This app helps you to make a list of grocery items along with its price and quantity.

      b. Purpose

People forget the things they need to because of busy schedule in their life. Nowadays people are more sophisticated with technology, and they tend to make remainder in their phone apps. This app helps people to make a list of grocery items they tend to buy and they can track their expenditure.

2. Literature Survey

      a. Existing Problem

Users may forget the things to buy because of that they need to visit the shop again. This leads to frustration for customers as well for shop owners. Sometimes people failed to estimate the total amount needed to buy things and they carry some money. Because of this they need to drop some items.

b. Proposed Solution

   To overcome this problem Grocery app was build to help the customers to estimate the cost of the products and act as remainder to purchase the items.

3. Theoretical Analysis
   c. Block Diagram
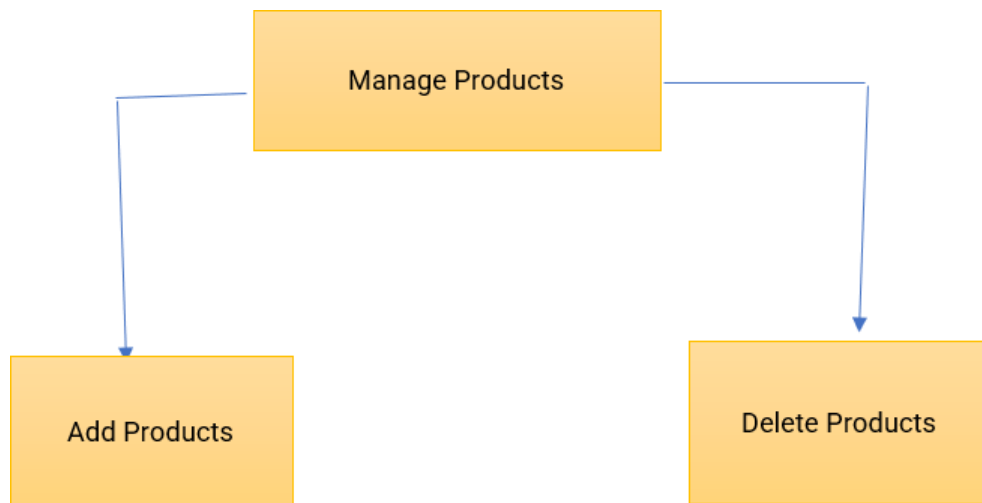

a. **Hardware/ Software Designing**

- Android Studio

- Windows 11 OS

- Ram 8GB

- 20 GB Memory

4. Experimental Investigations

In this project MVVM (Model View View Model) was used for architectural patterns, Room fordatabase, Coroutines and Recycler View to display the list of items.

Live Data:

A data holder class that can be observed. Always holds/caches the latest version of data, and notifies its observers when data has changed. Live Data is lifecycle aware. UI components just observe relevant data and don't stop or resume observation. Live Data automatically manages all of this since it's aware of the relevant lifecycle status changes while observing.

View Model:

Acts as a communication center between the Repository (data) and the UI. The UI no longer needs to worry about the origin of the data.

View Model instances survive Activity/Fragment recreation.

Repository:

A class that you create that is primarily used to manage multiple data sources. Entity: Annotated class that describes a database table when working with Room.

Room database:

Simplifies database work and serves as an access point to the underlying SQLite database (hides SQLiteOpenHelper). The Room database uses the DAO to issue queries to the SQLite database. SQLite database: On device storage. The Room persistence library creates and maintains this database for you.

DAO:

Data access object. A mapping of SQL queries to functions. When you use a DAO, you call the methods, and Room takes care of the rest.

RecyclerView:

It is a container and is used to display the collection of data in a large amount of dataset that can be scrolled very effectively by maintaining a limited number of views.
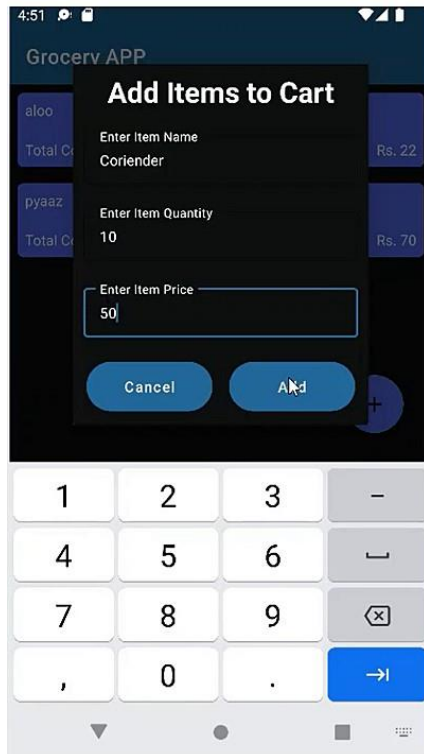

Coroutines:

Coroutines are lightweight thread, we use a coroutine to perform an operation on other threads, by this our main thread doesn't block and our app doesn't crash.

5. Flow Chart
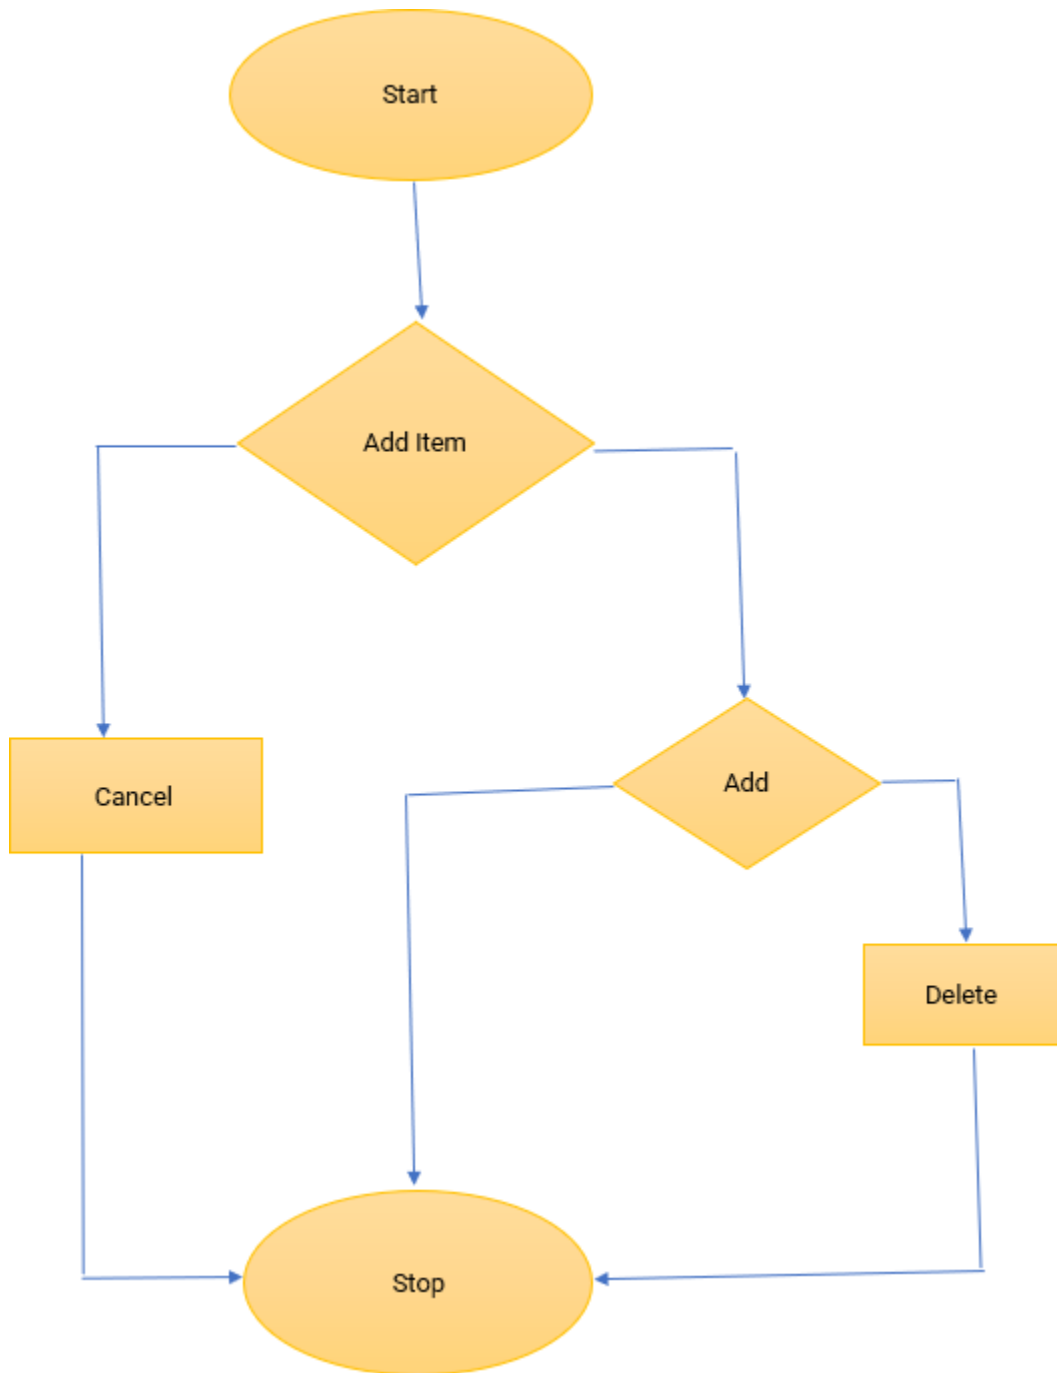

6. Result

7. Advantages and Disadvantages

Advantages:

- Estimate the budget the budget of the product

- App act as a remainder

Disadvantages:

- This app makes the people lazier to remember things

- People should be careful while entering price for estimation

8. Applications:

- This is widely used by old people to remember the items need to be purchased

- Grocery shopkeepers calculate the amount by using this app

- Some busy schedule working people use this app for estimate the budget for purchase

- Some people use this app as remainder to buy things

9. Conclusion

This Android app development project helped me to learn concepts like Room Database, Coroutines, MVVM, etc. Working on this project made me confident enough to apply my knowledge on android app development and to create an app for existing problem. I have used Kotlin to build this application and used android studio as a medium. All the functionality is coded in the classes and interfaces created and the layout is designed using xml.

10. Future Scope

This app can be connected to cloud for storage and tracking of information. Further this appcan be made to work on online with login credentials.

Appendix

MainActivity.kt

package com.rohan.groceryapp

```kotlin
import android.app.Dialog
import androidx.appcompat.app.AppCompatActivity
import android.os.Bundle
import android.widget.Button
import android.widget.EditText
import android.widget.Toast
import androidx.lifecycle.ViewModelProvider
import androidx.recyclerview.widget.LinearLayoutManager
import androidx.recyclerview.widget.RecyclerView
import com.google.android.material.floatingactionbutton.FloatingActionButton

class MainActivity : AppCompatActivity(),
GroceryRVAdapter.GroceryItemClickInterface {
    lateinit var itemsRv:RecyclerView
    lateinit var addFAB: FloatingActionButton
    lateinit var list: List<GroceryItems>
    lateinit var groceryRVAdapter: GroceryRVAdapter
    lateinit var groceryViewModal: GroceryViewModal
    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView(R.layout.activity_main)
        itemsRv = findViewById(R.id.idRVItems)
        addFAB = findViewById(R.id.idFABAdd)
        list = ArrayList<GroceryItems>()
        groceryRVAdapter = GroceryRVAdapter(list, this)
        itemsRv.layoutManager = LinearLayoutManager(this)
```

```kotlin
        itemsRv.adapter = groceryRVAdapter
        val grocreryRepository = GroceryRepository(GroceryDatabase(this))
        val factory = GroceryViewModalFactory(grocreryRepository)
        groceryViewModal =
ViewModelProvider(this,factory).get(GroceryViewModal::class.java)
        groceryViewModal.getAllGroceryItems().observe(this, {
            groceryRVAdapter.list = it
            groceryRVAdapter.notifyDataSetChanged()
        })
        addFAB.setOnClickListener{
            openDialog()
        }
    }

    fun openDialog() {
        val dialog = Dialog(this)
        dialog.setContentView(R.layout.grocery_add_dialog)
        val cancelBtn = dialog.findViewById<Button>(R.id.idBtnCancel)
        val addBtn = dialog.findViewById<Button>(R.id.idBtnAdd)
        val itemEdt = dialog.findViewById<EditText>(R.id.idEditItemName)
        val itemPriceEdt = dialog.findViewById<EditText>(R.id.idEditItemPrice)
        val itemQuantityEdt = dialog.findViewById<EditText>(R.id.idEditItemQuantity)

        cancelBtn.setOnClickListener{
            dialog.dismiss()
        }
        addBtn.setOnClickListener{
            val itemName: String = itemEdt.text.toString()
            val itemPrice: String = itemPriceEdt.text.toString()
            val itemQuantity: String = itemQuantityEdt.text.toString()
            val qty : Int = itemQuantity.toInt()
            val pr:Int = itemPrice.toInt()
            if(itemName.isNotEmpty() && itemPrice.isNotEmpty() &&
itemQuantity.isNotEmpty()){
                val items = GroceryItems(itemName,qty,pr)
                groceryViewModal.insert(items)
                Toast.makeText(applicationContext, "Item Inserted",
```

```kotlin
Toast.LENGTH_SHORT).show()
            groceryRVAdapter.notifyDataSetChanged()
            dialog.dismiss()

        }else{
            Toast.makeText(applicationContext, "Please enter all the data",
Toast.LENGTH_SHORT).show()
        }
    }
    dialog.show()
}

override fun onItemClick(groceryItems: GroceryItems) {
    groceryViewModal.delete(groceryItems)
    groceryRVAdapter.notifyDataSetChanged()
    Toast.makeText(applicationContext,"Item Deleted",
Toast.LENGTH_SHORT).show()
    }
}
```

GroceryDatabase.kt

```kotlin
package  com.rohan.groceryapp

import android.content.Context
import androidx.room.Database
import androidx.room.Room
import androidx.room.RoomDatabase

@Database(entities = [GroceryItems::class], version = 1)
abstract class GroceryDatabase : RoomDatabase(){

    abstract fun getGroceryDao() : GroceryDao

    companion object{
        @Volatile
```

```kotlin
        private var instance: GroceryDatabase? =null
        private val LOCK = Any()

        operator fun invoke(context: Context) = instance ?: synchronized(LOCK){
            val groceryDatabase = instance ?: createDatabase(context).also {
                instance = it
            }
            groceryDatabase
        }

        private fun createDatabase(context: Context) =
            Room.databaseBuilder(
                context.applicationContext,
                GroceryDatabase::class.java,
                "Grocery.db"
            ).build()
    }
}
```

GroceryItems.kt

```kotlin
package com.rohan.groceryapp

    import androidx.room.ColumnInfo
    import androidx.room.Entity
    import androidx.room.PrimaryKey

    @Entity(tableName = "grocery_items")
    data class GroceryItems (

        @ColumnInfo(name = "ItemName")
        var itemName:String,

        @ColumnInfo(name = "ItemQuantity")
        var ItemQuantity:Int,
```

```kotlin
      @ColumnInfo(name = "ItemPrice")
      var ItemPrice:Int,

   ){
      @PrimaryKey(autoGenerate = true)
      var id:Int? = null

   }
```

GroceryRspository.kt

```kotlin
package com.rohan.groceryapp

   class GroceryRepository(private val db: GroceryDatabase) {

      suspend fun insert(items: GroceryItems) = db.getGroceryDao().insert(items)
      suspend fun delete(items: GroceryItems) = db.getGroceryDao().delete(items)

      fun getAllItems() = db.getGroceryDao().getAllGroceryItems()

   }
```

GroceryRVAdapter

```kotlin
package com.rohan.groceryapp

   import android.view.LayoutInflater
   import android.view.View
   import android.view.ViewGroup
   import android.widget.ImageView
   import android.widget.TextView
   import androidx.recyclerview.widget.RecyclerView

   class GroceryRVAdapter(var list: List<GroceryItems>,
```

```kotlin
            val groceryItemClickInterface: GroceryItemClickInterface
            ) : RecyclerView.Adapter<GroceryRVAdapter.GroceryViewHolder>() {

    inner class GroceryViewHolder(itemview:View):
RecyclerView.ViewHolder(itemview){
        val NameTV = itemview.findViewById<TextView>(R.id.idTVItemName)
        val QuantityTV = itemview.findViewById<TextView>(R.id.idTVQuantity)
        val rateTV = itemview.findViewById<TextView>(R.id.idTvRate)
        val amountTV = itemview.findViewById<TextView>(R.id.idTVTotalAmt)
        val deleteTV = itemview.findViewById<ImageView>(R.id.idTVDelete)
    }

    interface GroceryItemClickInterface{
        fun onItemClick(groceryItems: GroceryItems)
    }

    override fun onCreateViewHolder(parent: ViewGroup, viewType: Int):
GroceryViewHolder {
        val view =
LayoutInflater.from(parent.context).inflate(R.layout.grocery_rv_items,parent,false)
        return GroceryViewHolder(view)
    }

    override fun onBindViewHolder(holder: GroceryViewHolder, position: Int) {
        holder.NameTV.text = list.get(position).itemName
        holder.QuantityTV.text = list.get(position).ItemQuantity.toString()
        holder.rateTV.text = "Rs. "+ list.get(position).ItemPrice.toString()
        val itemTotal : Int = list.get(position).ItemPrice + list.get(position).ItemQuantity
        holder.amountTV.text = "Rs. "+ itemTotal.toString()
        holder.deleteTV.setOnClickListener {
            groceryItemClickInterface.onItemClick(list.get(position))
        }

    }
```

```kotlin
        override fun getItemCount(): Int {
          return list.size
        }
      }
```

GroceryViewModel.kt

```kotlin
package com.rohan.groceryapp

    import androidx.lifecycle.ViewModel
    import kotlinx.coroutines.GlobalScope
    import kotlinx.coroutines.launch

    class GroceryViewModal(private val repository: GroceryRepository) : ViewModel() {
      fun insert(items : GroceryItems) = GlobalScope.launch {
        repository.insert(items)
      }

      fun delete(items: GroceryItems) = GlobalScope.launch {
        repository.delete(items)
      }

      fun getAllGroceryItems() = repository.getAllItems()
    }
```

GroceryViewModelFactory.kt

```kotlin
package com.rohan.groceryapp

    import androidx.lifecycle.ViewModel
    import androidx.lifecycle.ViewModelProvider

    class GroceryViewModalFactory (private val repository: GroceryRepository) :
    ViewModelProvider.NewInstanceFactory(){
```

```
override fun <T : ViewModel> create(modelClass: Class<T>): T {
    return GroceryViewModal(repository) as T
}

}
```
